### REASON FOR ALLOWANCE

1. Kuramori et al and Shimura et al disclose various types of tire wheel assembly comprising a run-flat support member constituted of a circular elastic shell and elastic rings inserted into a cavity of the pneumatic tire in which the circular shell has a support surface thereof extended toward the periphery of the tire and leg portions along each side of the support surface over a peripheral portion of the rim. The load support core member having a channel therein. Blazer et al disclose a tire monitor apparatus comprising a retainer assembly which is used to secure a removable module to the rubber ply such that the module is supported within the tire's cavity. Koch et al disclose a combination of pneumatic tire and monitoring device comprising a mounting structure which is attached to the inside of the tire by adhesive, an antenna extending from the housing. However, none of the references of record suggests a mounting structure of a tire monitoring device, wherein the tire monitoring device is disposed on a sidewall of the support core member and a transmission antenna of the tire monitoring device is disposed outside of the support core member in the manner defined in the instant claim 1 and in combination with other limitations of the claim. Also, none of the references of record suggests a mounting structure of a tire monitoring device comprising a load support having a channel, wherein the tire monitoring device is disposed in the channel and a transmission antenna of the tire monitoring device is disposed outside of the support core member in the manner defined in the instant claim 2 and in combination with other limitations of the claims. Therefore, claims 3-5, depending therefrom, are considered to be allowable.
